

Measured Building Survey Elevations and Floor Plans

The production of accurate elevations and floorplans is an essential part of many building projects - particularly for older buildings. Brunel Surveys Ltd have many years of experience in producing elevations and floorplans for a wide range of projects.

Elevations are measured by a non-contact laser theodolite and interlaced with rectified photography, providing quick and accurate detailed drawings.

Anything is possible, from basic outline elevations to complex and details drawings of historical buildings.

Brunel Surveys utilise closed loop traverses and fast, accurate surveying which, when coupled with computer drafting give very accurate floor plans.

We will shortly be using a 3d laser scanner for some elevations, which will enable us to work more quickly and to an even greater degree of accuracy.
