

Topographic Survey Highway Surveys

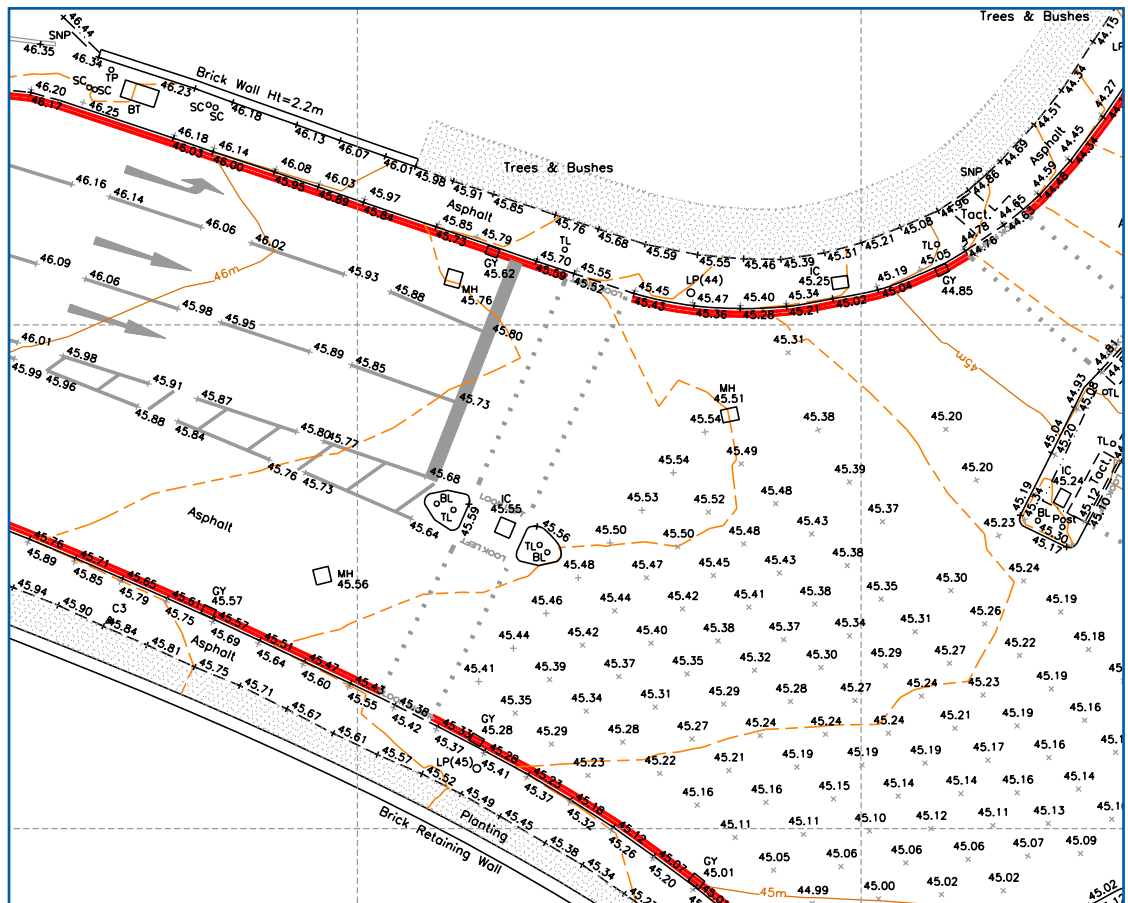

Brunel Surveys has many years experience of supplying high quality highway surveys to both the public and private sectors.

We are able to provide surveys in Autocad 2d and 3d formats as well as Microstation and MX.

Safety and Traffic management are always concerns when working on highways. It is a little known fact that even to stand on a street corner and take a photograph you should be trained to Streetworks 2. This is a City and Guilds qualification that qualifies you to work on traffic management on urban and county roads. All of our staff working on these jobs are trained to streetworks 2, with most being trained to streetworks 10 (supervisor).

We have supplied countless surveys to companies such as Mouchel, Balfour Beatty, Atkins as well as many local authorities.

The example shown below is a portion of road where we provided both 2d and 3d survey data (Autocad and MX). Close to junctions the client required levels every 2 metres along the kerblines and other breaklines. This junction has a large area of asphalt with no obvious breaklines, so we did a surface scan at 2metre intervals. Please note that this was on a red route in London and the work was carried out with no disruption to traffic.
