

Visualisation Verified Views

There are times when no amount of architect's or developer's drawings can convey the impact a new development can have on an area.

When particularly contentious proposals are placed before planning authorities the use of accurate, verified views can be of enormous help.

Brunel Surveys Ltd have a long history of producing images suitable for planning enquiries, using a mixture of software, graphical knowledge and surveying skill to ensure any development is shown accurately.

Some of the most hotly contested developments are windfarms, and Brunel Surveys Ltd is experienced at producing imagery for these projects as we have been involved in farms ranging from single turbines to massive, multiple turbine installations.

One such project involved placing five turbines in a field just outside Swindon. Brunel Surveys Ltd were called on to produce a series of images from various locations to show the impact on the surrounding countryside. Our ability to accurately place 3d models within a photograph that contains no reference points was key to the successful completion of this contract.
